Chapter 1 told me a bunch of different things about HTML. I did not know much about it before this class and one of the things it taught me about was tags. Tags are used to tell a web browser how to display the text contained in a file. These text files that have these tags are called HTML documents. You can also tag HTML documents to each other using anchor tags.

While I did know a little bit about URLs, I learned a bit more about what its acronym and what it does. URL stands for Uniform Resource Locator, and it displays a webpage. It has a couple of different parts. It has a protocol to use when transporting the file, a domain name of the computer which it's on, the path to the computer it's on, and the name of the file. Some of the different protocols it uses are Hypertext Transfer Protocol (HTTP) and File Transfer Protocol (FTP).
