

Chapter 10 introduces us to Data on the Internet. One of the things it goes over are the many different concepts that data scientists use. One of the terms that interested me was Data Anonymization. It's the process of removing any personal information from data. It is mainly used to protect the privacy of the person that is in data. I find this interesting as I also like to remove my information from websites or services I no longer use whenever I can or could as I don't want that entity to keep that data at all.

Another thing was an API, application-programming interface. I had heard of an API coming up in conversations with my friends but never knew what it really was. It is a set of rules that use an application by writing programs that interact with the data and routines of the application. It is nice knowing what it is instead of just questioning it every time it comes up.
