Module 4 goes over ways on filtering different searches to find different types of information whether it would be on a simple google search or if you are looking for more information on the weather. It's interesting to see that every website has a different way of doing this. I like how weather websites give you so much information that if you need to plan something out, they can be a helpful tool in avoiding days that are less than ideal for any sort of outing with friends and family. It was also interesting to see some of the text gives out. In the employment search section for example, I'm used to seeing pages like LinkedIn as an employment search page and never knew about CareerBuilder. It will probably be a website I could use in the future to search for employment.

It also goes over things like copyright, fair use and guidelines for citing resources. One interesting thing was on periodical databases. It's something I don't think about often, but you could go on to a website owned by a news organization and go through a lot of its old articles. I would say that it seems weird that a website like Wired would only have a couple different ways to filter your search on its website to find what you're looking for, at least by looking at the example given in the textbook.
